

CODEx SETUP PROMPT v2.1 — FINAL / LOCKED

SUMMARY

Optimize for verified engineering quality, repository understanding, development speed, context efficiency, safety, reproducibility, low retry/debug overhead, low maintenance burden, and interoperability with Claude Code and future coding agents. Primary optimization metric: tokens per verified successful task.

TECHNICAL SKILLS

Codex CLI/App Runtime Auditing
Codex Configuration Management
Idempotent Configuration Changes
Project Trust and Approval Policy Management
Sandbox and Safety Boundary Enforcement
Codex Rules / Exec Policy
Hook Auditing and Merge Policy
Secrets and Environment Variable Protection
Graphify Integration and Freshness Policy
Progressive Disclosure Retrieval
Codex Skills Design
Native Codex Review
Single-Agent and Subagent Routing
Git Worktree Policy
MCP Surface Minimization
Reasoning Effort Routing
Native Memory Policy
Native Compaction Policy
Progressive Verification
Retry Loop Control
Cross-Agent (Codex/Claude) Interoperability

MISSION

Build a production-grade, token-efficient Codex development environment for this repository. Do NOT optimize for the number of installed AI tools.

CORE PRINCIPLE

Capability exists ≠ capability must always be active.

PRIMARY OPTIMIZATION METRIC

tokens per verified successful task

SECONDARY METRICS

tool calls per verified task; retry rate; repeated-read rate; broad-search rate; verification success rate; latency where measurable

FINAL RULE

Native first. Progressive disclosure. Measure second. Escalate only when evidence requires it.
